

Sulphur 2020-21

- Sulphur has been a problem and a key topic over the last two decades.
- Increased awareness and trials have seen increased usage of sulphur.
- More and more fertiliser grades now contain sulphur.
- Better use and understanding of organic manures such as FYM, Poultry Manure, digestate and compost have helped.
- We have seen higher than average rainfall during the winter months. Sulphur is extremely soluble and mobile in the soil but soil and leaf tests show better levels. This is due to better utilization of the product and understanding.
- Timings are crucial. Historically it was applied with the first application. Now it is applied little and often with each application which is a better and more effective policy.
